

Back Up your Project Files

This instruction will guide you how to back up your Quartus project files

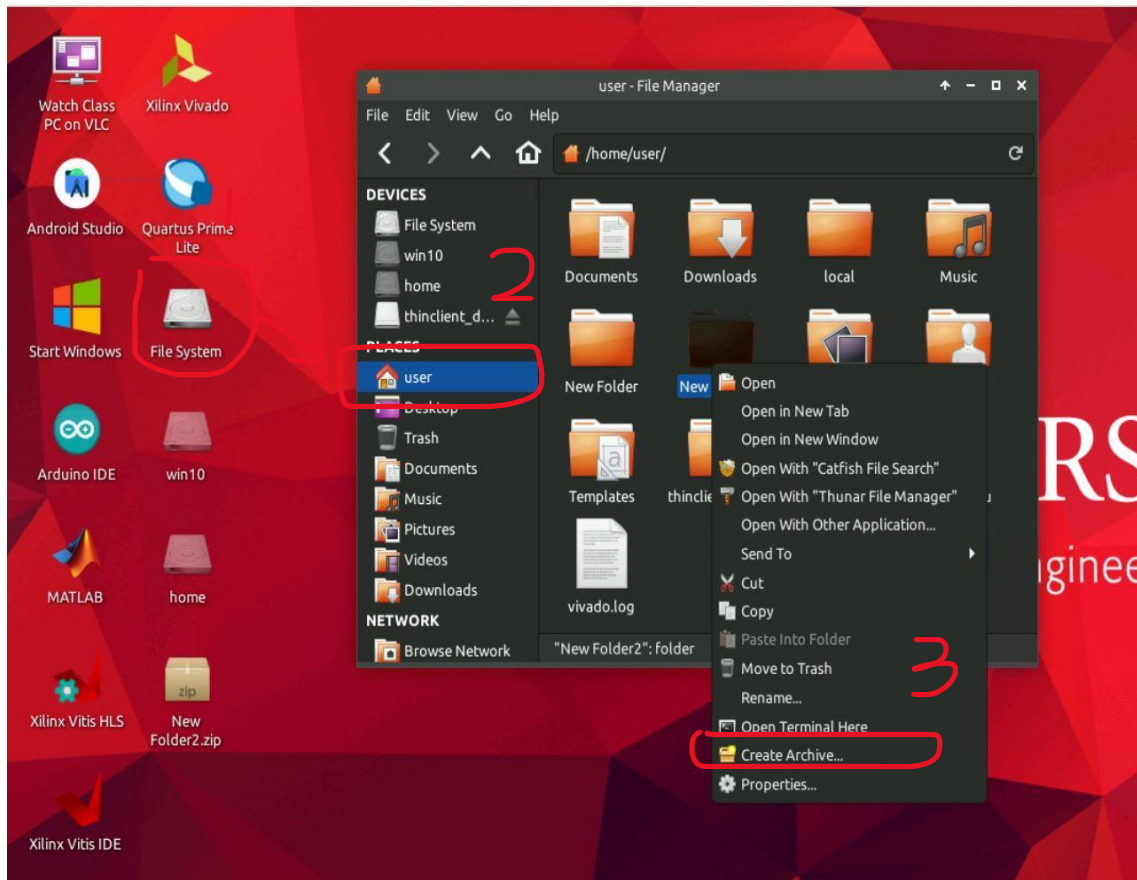

1. In the menus of Quartus II, go to 'File -> Save all' to make sure you save all the changes of current work

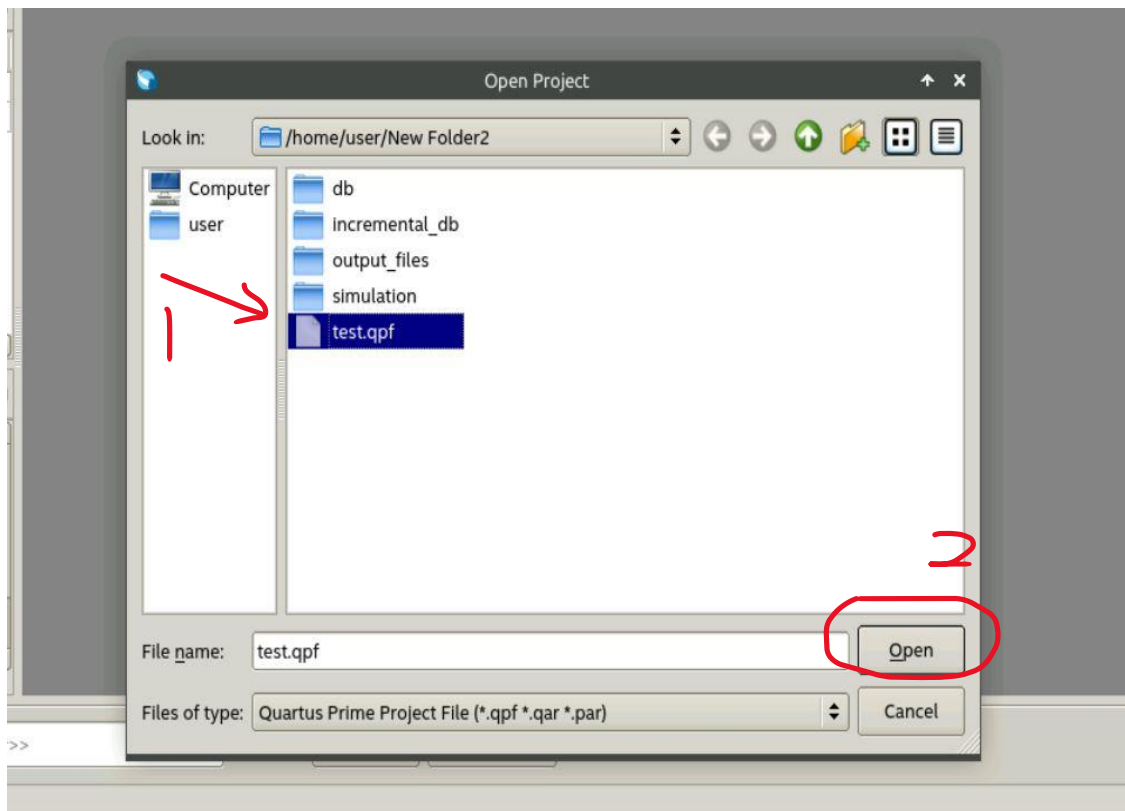

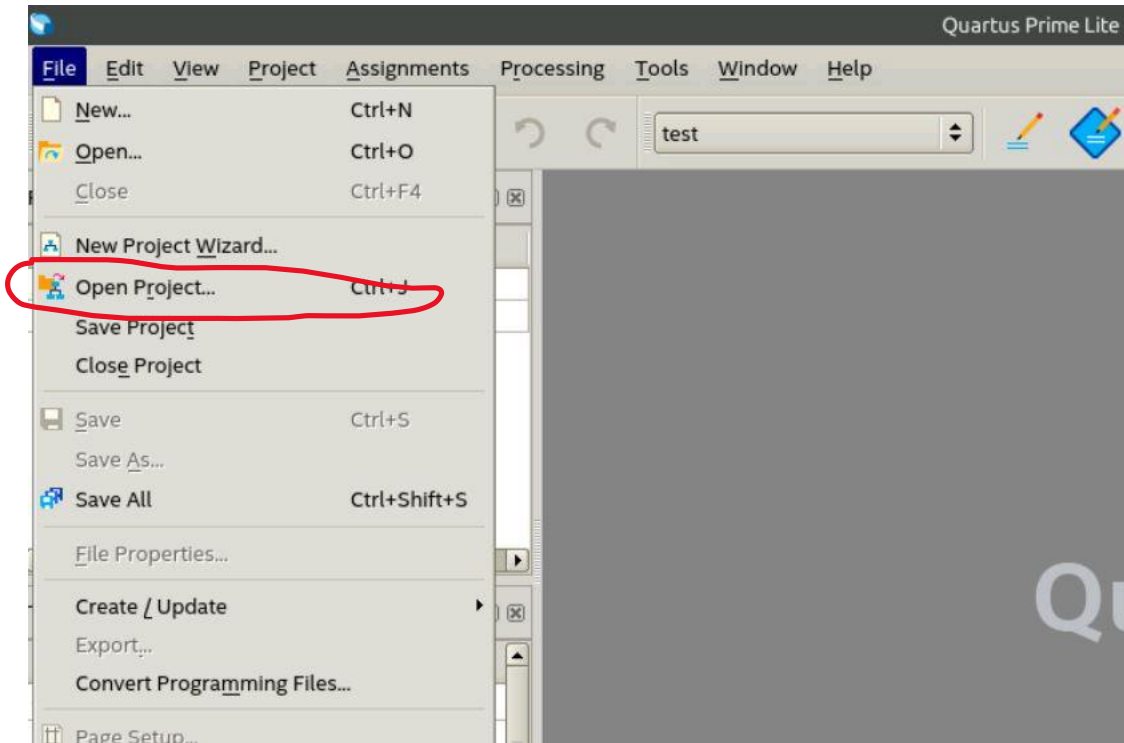

2. Then Go to your project directory and save a zip file copy of the project folder. The path for your project folder is the one you choose on creating project.

In vlab machine, you can do like example below. Just keep in mind that you need to save the entire project folder instead of just several files.

3. Upload the zip file to whatever drive you like (Google drive, email, dropbox or something else). Now you already finished up the back up of your project.
4. When you want to continue the project in a new machine or different operation system. Download the zip file and extract the project holder on the exact same location in the new system. Then when you launch Quartus II, click open project and navigator to the project path and open it.

5. Then you can navigator and continue your work from the project navigator bar on the left.
Enjoy your Lab!
